**Languages:** Python, Node.js, Typescript, JavaScript, React, Angular, HTML & CSS, Java, C++, SQL

**Tools & Infrastructures:** Git, Bitbucket, Docker, Kubernetes, Grafana, Octant, Jira, Confluence

## Work Experience

### Software Engineer

**May 2024 - Present**

*Premier America Credit Union*

- Built an API integration with the core banking system to automate check deposit hold decisions for consumer and business members, reducing fraud by approximately 70% and cutting manual internal work by approximately 40%, using Angular, TypeScript, and Node.js.
- Built and launched a new digital account opening and online banking platform, reducing manual internal workflows by approximately 50% and collaborating across multiple departments to gather requirements and resolve bug tickets.
- Built and launched remote deposit capture and business ACH enrollment for business members, integrating third-party platforms through secure RESTful APIs using React and Python.
- Proposed and led an in-house UI/UX solution that reduced build and release turnaround from up to 3 sprints to 1 sprint, shifting delivery ownership to internal developers and minimizing vendor bottlenecks.
- Implemented an ETL-style backend pipeline to extract and transform share and loan data into standardized objects, enhancing database models and API responses to support new share types and downstream integrations.
- Rapidly designed and deployed a mitigation for a high-impact security vulnerability, reducing exposure risk and strengthening system integrity.
- Designed and implemented a notification routing system that groups internal team members and triggers targeted email alerts based on group assignment and the type of form submitted by online banking members — currently being extended into a fully automated workflow.
- Collaborated with QA to build a Java CLI tool that transforms CSV-based test cases into structured JSON payloads, accelerating test execution and reducing formatting errors.
- Developed a Python script to automate the generation of digital certificates required for secure communication with external applications, reducing manual setup time and risk of configuration errors.
- Maintained and enhanced the online banking website by adding member promotions to the enrollment process, implementing bug fixes using production logs and test environment debugging, and rolling out new features to improve functionality and user experience.
- Developed a credit card rewards page in Angular and TypeScript, surfacing available rewards and application options directly to online banking members.
- Developed onboarding documentation and hands-on training for interns and new hires, outlining key system integrations, workspace navigation, and required tools and access.
- Directed daily scrum meetings and end-of-sprint stakeholder demos, tracking deadlines, resolving blockers, and keeping the organization aligned on project progress.

### Software Engineer Intern

**August 2022 - May 2023**

*Santa Barbara Public Defenders*

- Developed a comprehensive internal ticketing system using Microsoft PowerApps, equipping the IT department with streamlined tools for issue monitoring and resolution.
- Participated in backlog refinement meetings to prioritize tasks and advance projects toward deadlines.
- Implemented version control strategies within PowerApps, enabling collaboration and efficient code management across a large team.

## Education

**May 2023**

**California State University, Los Angeles**

*Bachelor of Science in Computer Science*
